# Objective

**The main objective of this research is to test the hypothesis that more accurate soil moisture information can be derived from SMOS if vegetation attenuation and land surface temperature information are derived from other coincident remote sensing observations (MODIS, WindSat, MTSAT-1R, etc.).**

## Radiometer measurements are sensitive to:

- **Soil moisture content**
- **Vegetation Water Content**
- **Surface roughness**
- **Soil Properties**
- **Land Surface Temperature**
- **...**

## **SMOS Assumptions** (relevant to this research)

**Assumption 1:** Soil surface temperature and soil deep temperature will be extracted from ECMWF (European Centre for Medium-Range Weather Forecasts) products.

**Assumption 2:** Using LAI for computing optical depth. LAI will be obtained from ECOCLIMAP which is a global database for land surface parameters.

## **This thesis will address four key research questions as outlined below:**

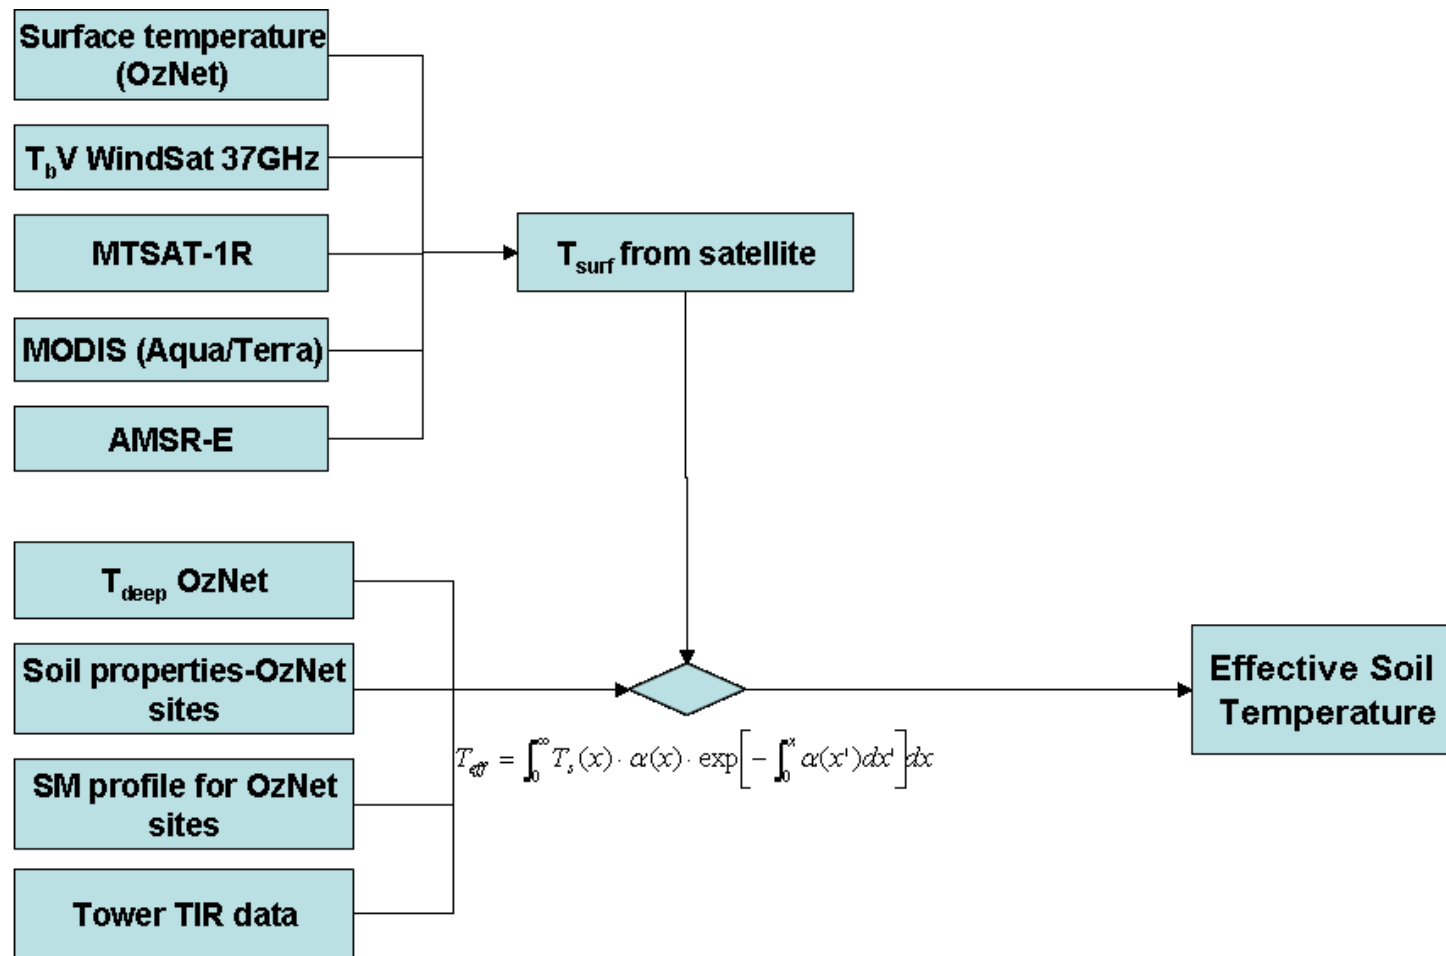

- Can effective temperature be estimated from MODIS and WindSat satellites to a satisfactory accuracy?
- How estimated VWC from MODIS, WindSat and MTSAT-1R derived Vegetation Indexes can improve retrieved soil moisture?
- Can a multi-sensor approach demonstrate a suitable soil moisture retrieval accuracy using data from NAFE'06 and AACES?
- How a multi-sensor approach can improve the SMOS soil moisture product?

- **NAFE'06** (National Airborne Field Experiment)
- **AACES** (Australian Airborne Cal/Val Experiment for SMOS)
- **SMOS** (L1c, L2)
- **MODIS**
- **WindSat**
- **MTSAT-1R**
- **OzNet monitoring stations**
- **BoM Forcing Data**

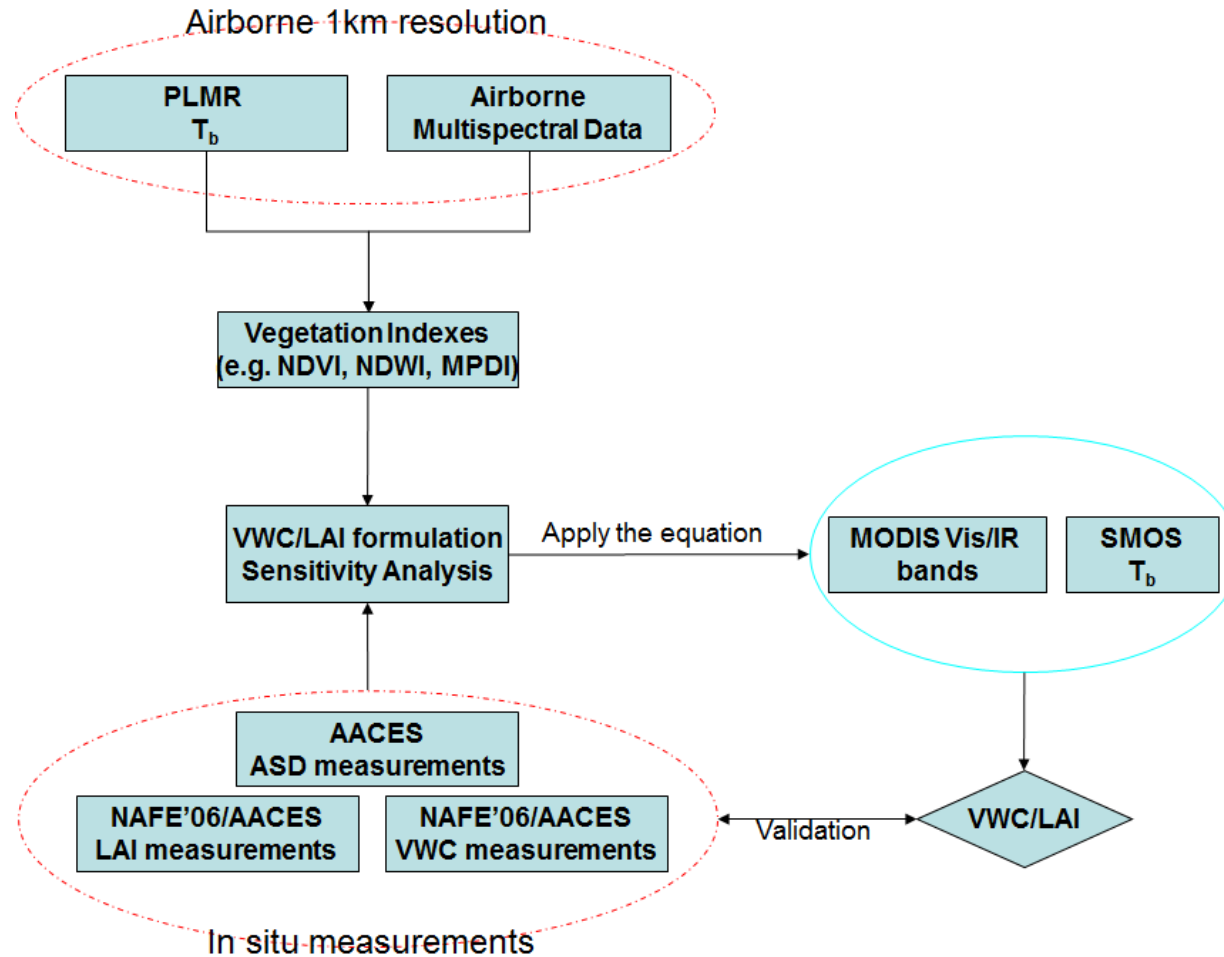

## Q1: Effective Soil Temperature

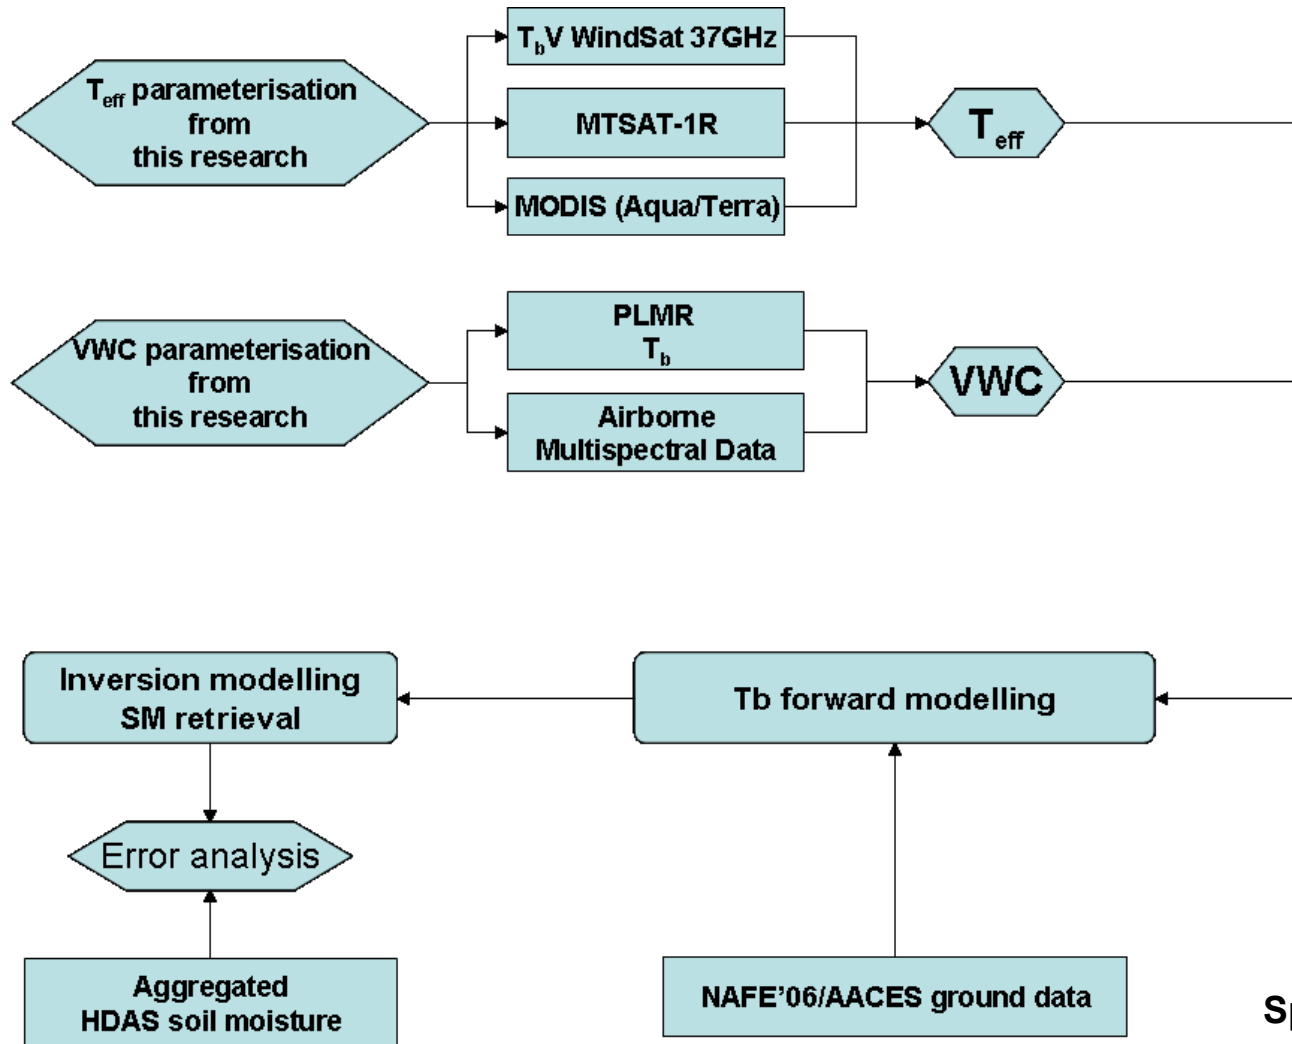

## Q2: Vegetation Water Content

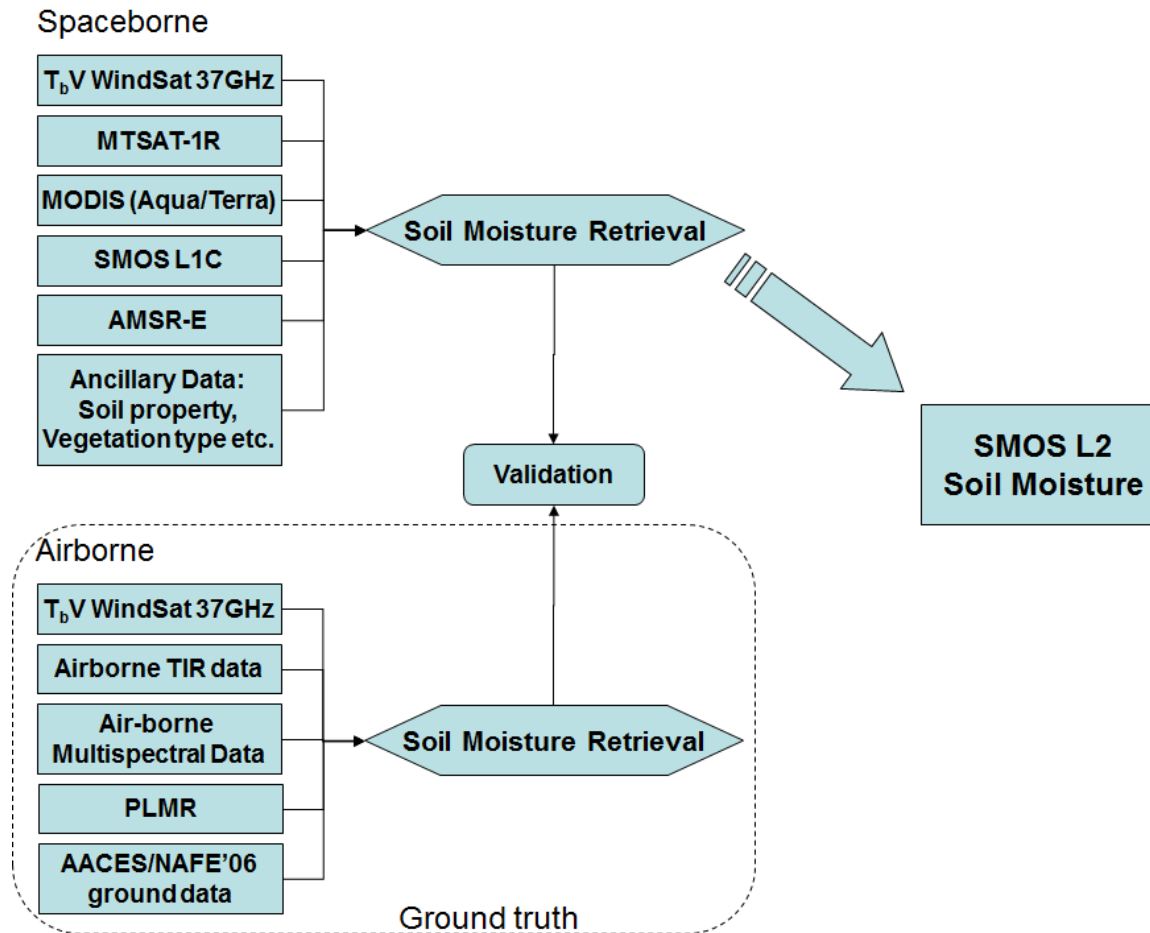

## Q3: Airborne Multi Sensor Retrieval

## Q4: Spaceborne Multi-Sensor Retrieval

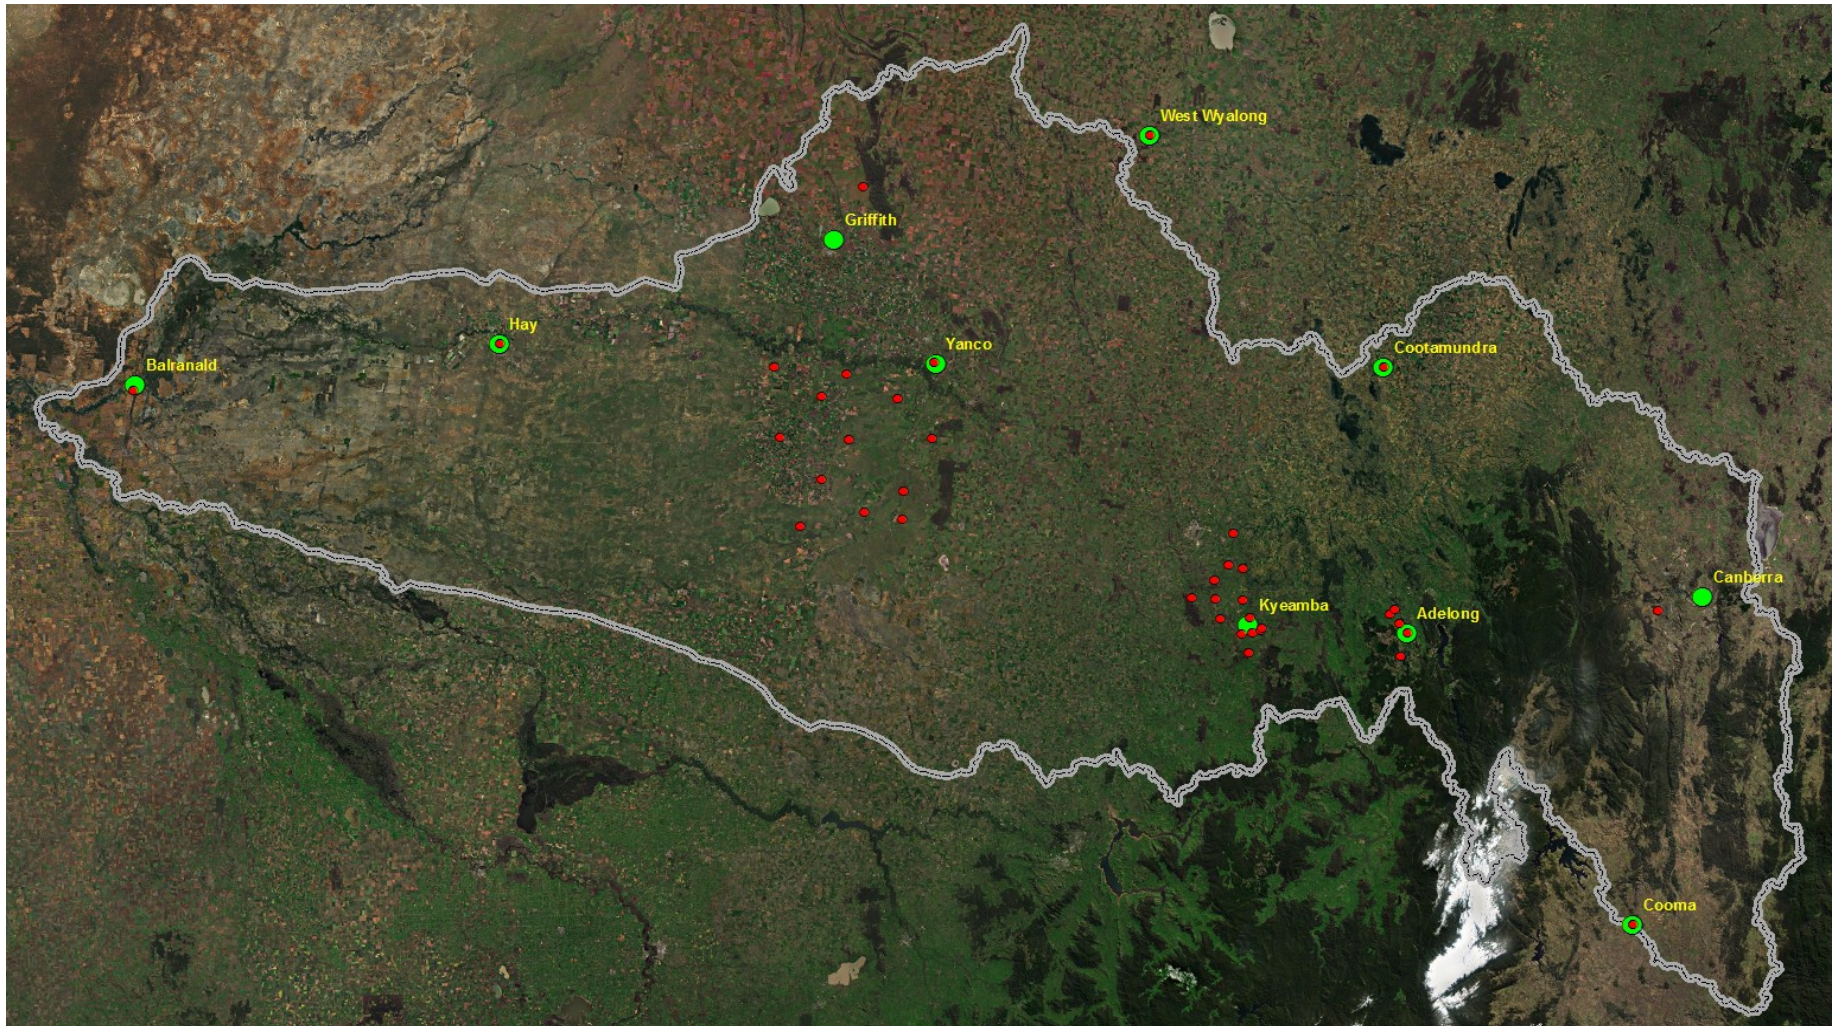

**Spatial Resolution: ~50km**

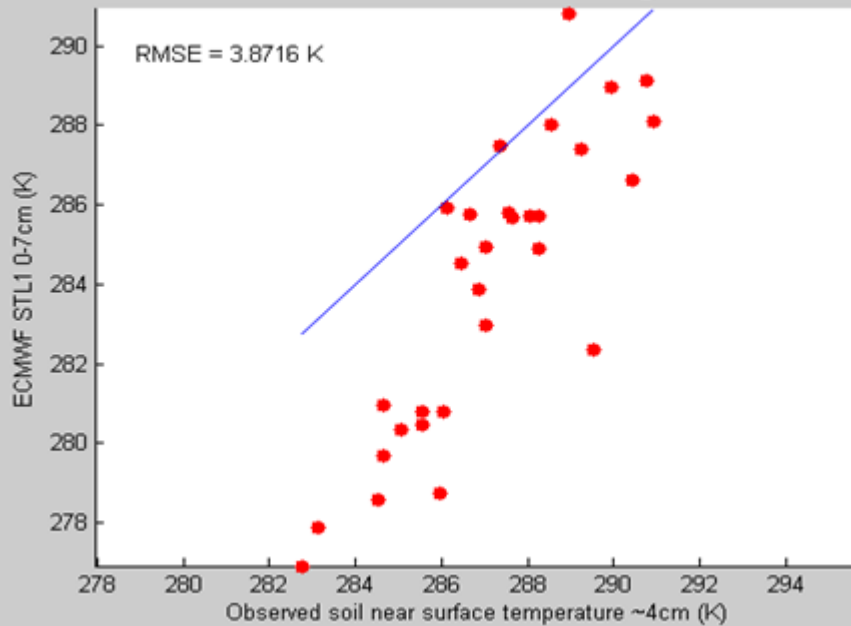

# Study Area

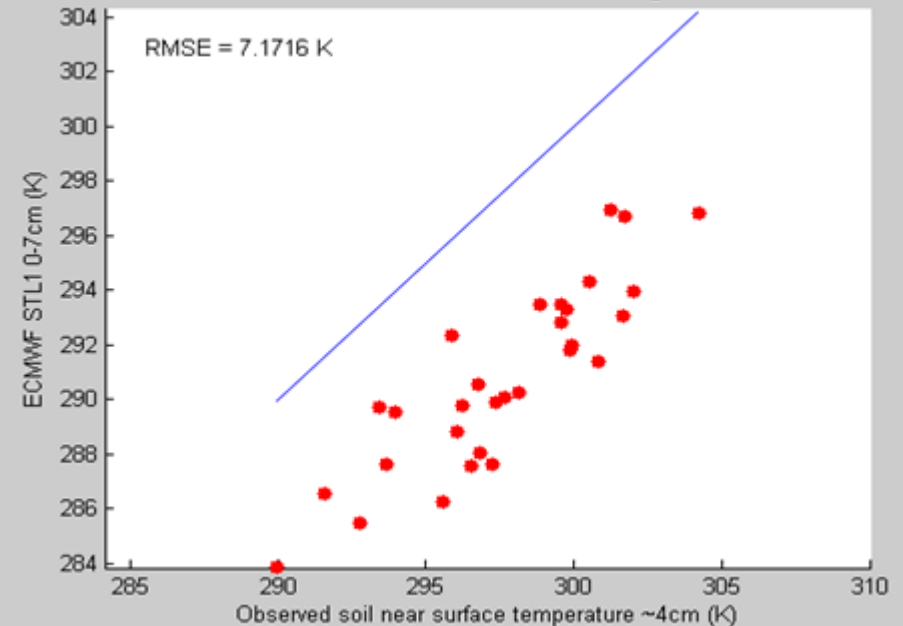

# Observed vs. forecasted soil temperature

Observed vs. Forecasted soil temperature on "M1" @ November 2006

Observed vs. Forecasted soil temperature on "M5" @ November 2006

# Tb Perturbation (-4 K for STL1)

\*Assuming vegetation temperature and deep soil temperature are correct  
sand 0.6, clay 0.2 using default values for L-MEB
